

## Covid19 Testing Visual Guide

**If the doctor thinks that I might have Covid 19, I may have to have a test to check if I do.**

**I might not feel sick or unwell, but the doctor may still decide I need to have a test.**

**This is to keep me safe and others around me safe.**

**If the doctor decides I need a test there are three ways this might happen;**

**1**

**If I live in a rural area or far from a hospital, someone may come in an ambulance to test me at my house.**

**2**

**An appointment might be made for me to visit a Testing Centre close to me. I can leave after the test is finished.**

**3**

**If I am unwell and staying in hospital, the doctor in the hospital will test me there.**

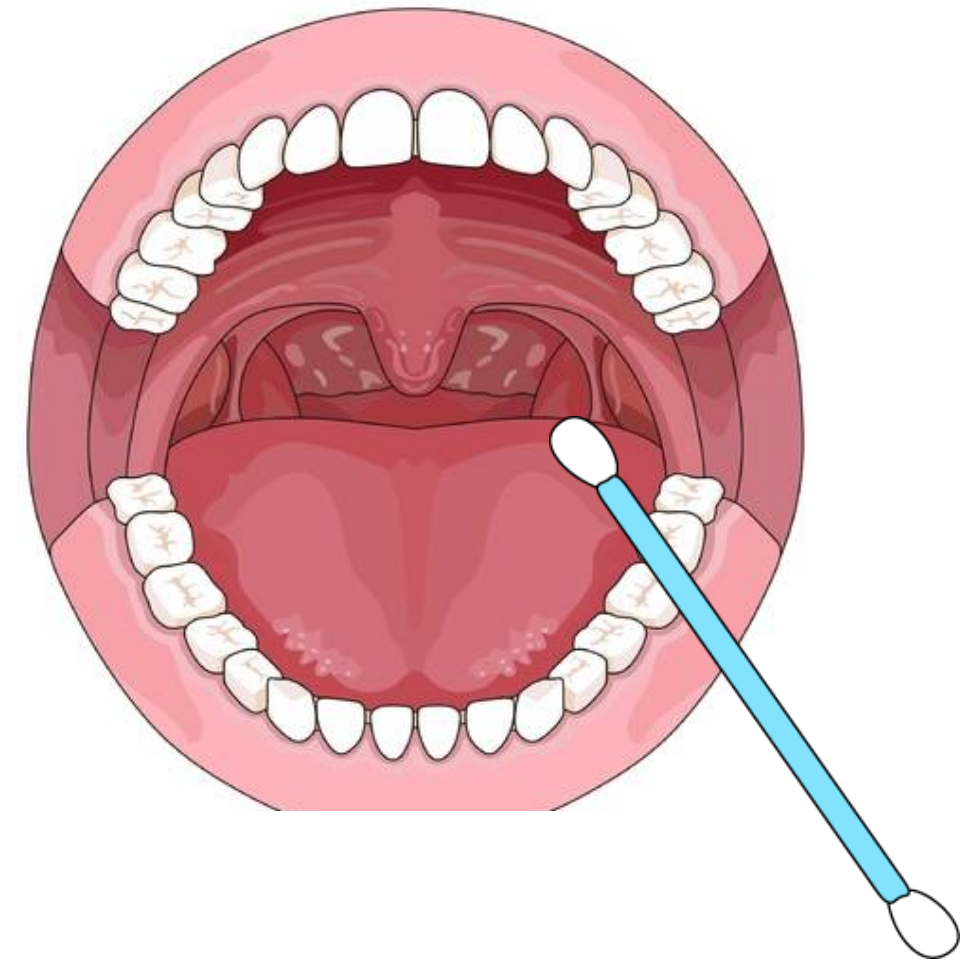

**When the doctor or medical worker is testing me, they will use a swab.**

**A swab is a small thin stick with cotton wool at the end.**

**They will;**

**Put the swab in my mouth and rub the inside of my throat**

**Put the swab up my nose and rub the inside of my nose**

**I might not like the feeling of this, and that is ok. It will be over very quickly, and the doctor or medical worker needs to do this to check if I am unwell.**

**When the test is finished, the doctor will send the results to a laboratory to be checked.**

**It may take a few days to get the results. During this time, I should still be careful to wash my hands and self isolate.**

**If the test shows I have Covid 19, the doctor will call, I do not need to panic. The doctor will tell me how to stay healthy. I will need to stay indoors until I am better.**

**If the test shows I do not have Covid 19, I still must be very careful with washing my hands, keeping my distance from people outside of my house and only going outside when I have to.**
